Chapter 1: Introduction

This document provides an overview on the Fiserv Rapid Connect® processing functionality, specific to Tokenization in payment acceptance. This reference guide is intended to be used in conjunction with the **Universal Message Format (UMF) specification.**

Merchants accepting Tokenization operate in a **cardholder present** and **cardholder not present** environments. Tokenization refers to the use of an association generated payment tokens replacing the cardholder PAN in a transaction processing.

Payment token issuance is performed by a token vault that generates and stores the payment token and the associated cardholder PAN. The operator of the token vault is referred to as the token service provider.

The token requestor is typically an acquirer, merchant or digital wallet provider that will use the payment token to replace the PAN in its database and in transaction processing.

1.1 Supported Payment Types and Transaction Types

The following table lists Industries, Transactions and Card Types supported by Rapid Connect for Tokenization:

Industry	Payment Type	Card Types	Transactions	Reversal Reason Code		
				Partial	Time Out	Void
Auto Retail Airline Ecommerce Lodging/Cruise Petroleum Retail/QSR Restaurant Supermarket	Credit	Visa MasterCard Discover Amex[1]	Authorization	✓	✓	✓
			Completion		✓	
			Sale			✓
			Refund		✓	
Auto Retail Airline Ecommerce	Debit		Authorization	✓	✓	✓
			Completion		✓	
			Sale		✓	✓
Lodging/Cruise Petroleum Retail/QSR Restaurant			Refund		✓	

[1] **Tokenization for Canada is only supported for American Express at this time.**

Chapter 2: Processing

2.1 Payment Acceptance

Please refer to the UMF specification for technical details of the topics below.

NFC

NFC refers to Near Field Communication, where the NFC device is sending a Token instead of the actual card number in the transaction.

In Application

In-Application (In-App) refers to E-Commerce transactions that include the Secure Transaction Group.

Card-on-File

In a Card-on-file transaction, the initial transaction is one of the above token transactions with a valid cryptogram. The token and token related data can be saved by merchants, and used in subsequent transactions, like Completions or Bill Payments.
