Chapter 1: Introduction

This reference guide provides an overview on TimeOut Reversal (TOR) testing as part of the overall Rapid Connect® certification process. This document is intended to be used in conjunction with the **Universal Message Format specification (UMF)** and corresponding TOR test cases for your individual certification effort.

Time-out Reversal testing (required) must be performed prior to moving your project to the Certification stage. There will be a final attended TOR test with your assigned Certification Analyst using test cases and various scenarios from your certification script.

***All test cases from the mandatory tab on your test scripts must receive a status of 'pass' before moving the project to next phase, unless otherwise noted by your Certification Analyst.**

**** The 120 second rule listed below pertains to certification testing only.**
Please check the UMF specification for rules in the production environment where any TOR must wait a minimum of 35 seconds.

Timeout Reversal Testing: Sequence of Operations:

1. When a specific card (as defined in the TOR test card numbers table below) is used and the dollar amount of the transaction is $45.67, the response to the authorization or completion transaction request message would not be sent back to you, simulating a first Time Out scenario.

2. Your application will need to send the first TOR within 120 seconds, with a minimum of 35 seconds.

3. The TOR response will not be sent back to your application, simulating a second Time Out scenario.

4. Your application will need to send the second TOR within 120 seconds, with a minimum of 35 seconds.

5. The second TOR response will not be sent back to your application, simulating a third Time Out scenario.

6. Your application will need to send the third TOR within 120 seconds, with a minimum of 35 seconds.

7. Finally, the third TOR response will be sent back to your application.

8. After a successful TOR response for the Authorization, the Authorization should be re-attempted manually within 120 seconds and the response will be sent back to your application successfully processed.

9. After a successful TOR response for the Completion, your application should then resend the original completion message within 120 seconds and the response will be sent back to your application successfully processed.

Note: If your application fails to execute any of the above Time Out reversal transactions within 120 seconds of the previous transaction, you will need to start the testing again scenario again from the beginning.

Chapter 2: Card/Token Indicators:

For all cards:

Transactions in the amount of $45.67 will receive No Host Response to simulate Time-out Reversal testing

(Please see the Time-Out Reversal Testing section below for Time-out Reversal testing scenarios).

Transactions below $100.00 will receive an Approved response.

Transactions above $100.00 will receive a specific Error response.

The transaction amount sent in the transaction request message is used to determine which error response code will be received in your response. To request an error response code, the last three digits of the transaction amount should be the response code you wish to receive.

For example, if you need to receive a response message with a 116 response code, then the request message could contain a transaction amount of $101.16. Likewise, if you need to receive a response message with a 318 response code, then the request message could contain a transaction amount of $403.18. A complete list of response codes can be found within Appendix A of the UMF specification in your SDK zip file.

Client can construct transaction using below table to simulate a TOR logic using Card or Token based on how application is designed.

Card/Token Number	Card/Token	TOR Test Indicator Flag (Y/N)	RC Test Indicator Flag (Y/N)
